SUBJECT INDEX

acrylates, α-substituted 189
alkyl methacrylates 239
α-substituted acrylates 189
aluminium porphyrin, coordination of lactone to 78–9
aluminium porphyrin catalyst 72–80
amic acids 329–31
aqueous systems 372–88
aromatic polyamides (ARAMIDS) 375
asymmetric membranes 341–3
ATP synthesis 30–1

biochemical processes, predictive value of 2–8
boundary water at real surfaces 22

catalysts 131
cation pumps 5
cellulose acetate 372–4
coordination ring-opening polymerization 63–81

dense membranes 341–2
desalination 372–88
dicarboxylic acids 332–3
differential scanning calorimetry 17
diffusion coefficients 349, 382
donors 130–1
Drost–Hansen paradoxical effect 22

electron relays 127–30
enthalpy–entropy compensation 26
enzyme binding, partial closure of 23
enzyme binding cavities 8–13
enzymes performing chemical work 5–6
epoxides
  polymerization of 79–80
  stereoselective polymerization of 64–72
equipotential volume model (EVM) 396–7
ethyl methacrylate (EMA) 205

gas separation membrane materials 350–71
group transfer polymerization (GTP) 241–3, 249

hydration of mixed hydrophilic/hydrophobic surfaces 11–13
hydrophilic/hydrophobic surfaces 11–13
hydrophobic force 20
hydrophobic surfaces, wetting of 9–10
hydrophobicity, and solvent uptake 21

immersion sorption kinetics 382
infrared spectroscopy 14, 24–6
interfacial charge separation 163–4
ion-containing membranes 394–8

lactones
  coordination in polymerization 72–80
  coordination to aluminium porphyrin 78–9
loose membranes 392–3

maleic anhydride (MAn) copolymers 277–337
  amidation 309–20
  autocatalysis 311–13
  carbonyl reactions 303–8
  catalytic amidation
    acid catalysis 313–14
    base catalysis 315
    dependence on molecular weight 317
    influence of solvent 315–17
    kinetics with excess anhydride 314–15
    phenomenon of limiting conversion 317–20
  catalyzed esterification
    acid catalysis 315
    base catalysis 325–6
  catalyzed hydrolysis 327–8
  esterification 320–6
  esterification rate and molecular weight 324–5
  experimental work 281–2
  hydrolysis 326–8
  model compound considerations 308–9
  photoinitiated copolymerization 282–5
  radical copolymerization theory 278–81
  reactions 303–8
  reactivity 297–303
    dissolution state 298–303
  recyclization 329–33
    amic acids 329

dicarboxylic acids 332–3
half-esters 331–2
solution copolymerization initiated with separate radical initiators 286–94
structure 294–7
uncatalyzed esterification 320–4
uncatalyzed hydrolysis 326–7
uncatalyzed reactions with aromatic amines 309–11
membrane materials 339–401
current problems 385–8
fundamentals 381–5
gas separation 350–71
selection factors 345–50
structure–property relations 381–5
membrane structures 341–4
membrane types 341–4
methacrylates
matrix polymerization of 234–40
polymerization by alkali metal compounds 199–213
polymerization by organomagnesium compounds 214–22
polymerization in THF by Grignard reagents 227
polymerization in toluene by phosphine complexes and aluminium amides 227
polymerization with benzoyl peroxide 239
stereoregular oligomerizations 243–8
stereoregular polymerization 190–9
methacrylic acid esters 233
1-methoxy-2-propanol 70–3
methyl methacrylate (MMA) 189–90
fate of initiator in polymerization of 202, 220
plasma polymerization 240–1
stereoregulation of polymerization 192
microheterogeneous systems 139–41
microporous membranes 344
microporous synthetic polymer membranes 8–13
mobile water clusters 13–18
solvent properties 16–17
summary of properties 17–18
molecular assemblies 131–9

Na^+/K^+ paradox 2–5, 29

packing-inhibited materials 366–8
permeability coefficients 347
pervaporation 389–92
photochemical ageing 104–6
photochemical redox processes 112
photoelectrochemical cells
electrodes coated with sensitizers and/or polymers 164–70
semiconductor electrodes coated with sensitizers and/or polymers 170–2
photoelectrochemical systems 160–76
photoenergy conversion 173–4
photogalvanic cells 174
photoredox systems 174
photoreduction of water 113–25
photosensitizers 125–7, 141–54
photosynthesis systems 176–8
photovoltaic cells 160–2
poly(alkyl methacrylate) 257
poly(α-substituted acrylate)s, stereoregularity of radically polymerized 198
poly-1-butene 37–62
applications 53–9
blends 58
cables 57
composites 57
copolymerization 41
crystal transformation 47–9
crystalline structure 45–7
crystallization 47–9
fibers 57
films and sheets 56
mechanical properties 51–2
molding 56
monomer production 38
pipes and tubes 55
polymerization 38–45
catalytic systems 38–45
kinetics 40–1
main processes 42–4
process characteristics 44–5
polymorphic behavior 45–7
properties and characterization 45–52
stereoregularity 49–51
poly(2-dimethylaminoethyl methacrylate) 261
polyimides 353–66
polymer blends 369–70
low molecular weight additives 370–1
polymer membranes 160–2
equilibrium state of water in 18–31
water structure in 1–35
poly(methyl α-aryloxymethylacrylate) 231
poly(methyl methacrylate) (PMMA) 189–276
dependence of tacticity on solvent and polymerization counterion 207
group transfer polymerization 241–3
heterotactic 229–34
highly isotactic, with narrow molecular weight distribution 222–4
highly syndiotactic 224–9

isotactic 263
NMR parameters for radically polymerized 191
number of initiator fragments and terminal methine protons per polymer molecule 204
properties in relation to tacticity 251–60
stereoregular macromonomers 248–51
stereoregularities of AIBN-prepared 194
stereoregularity of fractions of 215
tactic sequence distribution in 193
tacticity analysis 262–7
tacticity dependence of polymer reactivity 260–2
tacticity of 232, 237, 238, 241–3, 251–60
triad tacticity and coisotactic parameter 195
poly(phenyl methacrylate) 196
(porphinato) aluminium alkoxide 74
(porphinato) aluminium alkoxide-(porphinato) aluminium chloride system 76–8

Raman spectroscopy 14
reactive water, biochemical significance of 28–9
redox systems 163–4
relays 154–60
reverse osmosis 15, 373–93
loose membranes 392–3
separation of organics from water 388–9
solubility and mobility contributions for various aromatic polymers for 386
typical high performance materials for 376
useful life of membranes 16

semiconductors
for photoenergy conversion 173–4
photoanodic decomposition of 172
silicone rubber 'caulked' polysulfone membrane 344
solar cells 100–3
solar energy
conversion 112–60
storage 106–11
technologies 84–106
utilization 83–188
solar luminescence concentrators 99–100
solar photothermal energy collectors 85–95
solar ponds 84–5
solar reflectors (mirrors) 95–9
spin-lattice relaxation times 258
stereoregular polymerization 189–276
stereoselective polymerization of epoxide 64–72
stretched water 18–20
ATP synthesis as probe of 31
conversion to vapour-like water 29–31
effects of solutes upon infrared spectrum of 25
infrared spectrum of 24
release of ATP from 30–1
solvent properties of 23
structure-breakers 27
structure-makers 27

tetrahydrofuran (THF) 199–22, 227, 228, 232–4, 236
thin-film composites 344
triarylmethyl methacrylates 213, 230
triphenylmethyl methacrylate (TrMA) 212

δ-valerolactone 74
van der Waals volumes 349
vapour-like water 27–9
conversion of stretched water to 29–31
reactivity of 27–8
vinylbenzylmagnesium chloride 250

water
equilibrium state in polymer membranes 18–31
photoreduction of 113–25
water reactivity in closed enzyme cleft 6
water structure
in polymer membranes 1–35
in small hydrophobic domains 7
wetting of hydrophobic surfaces 9–10

zinc dialkoxide–ethylzinc alkoxide two-to-two complex 70–3
zinc dimethoxide–ethylzinc methoxide one-to-six complex 65–70
